**Measurement rooms and encapsulation systems from pinta acoustic – for precise acoustic analyses**

In non-reverberating measurement rooms, tests can be carried out on noise sources under conditions that are otherwise only found in a free-field environment. Complex sound sources can be analyzed for their directional characteristics in order to develop and improve systems. However, if you are aiming for reproducible measurement results, the special guidelines of ISO 3745 must be adhered to. pinta acoustic measurement rooms allow you to fulfill all the relevant requirements.

Soundproofing capsules are building-specific and tailored to your individual requirements. If required we can supply a capsule isolated from structure-borne noise. Additional lighting, ventilation and monitoring cameras can be incorporated into the overall system.
