**Screens and curtains – the mobile solution from pinta acoustic**

It is not always possible or economical to have a encapsulated enclosure – either because the noise only lasts for limited periods, or because mobile noise protection measures are needed owing to the fact that the noise source is not stationary. Therefore pinta acoustic has developed special acoustic screens and curtains. These are easily movable elements with absorbing and soundproofing properties. They can be installed with commercially available eye rings and can be cleaned with a high-pressure cleaner.
